

TASNEEN GOULD | SENIOR BUSINESS ANALYST

OVERVIEW

Listening to our clients and hearing that it would be useful to get information in and out of PayGlobal more easily, we have started on the journey to make integration between Exolvo and other systems seamless, real-time and simple.

This Exolvo feature means that you will be able to receive notifications via a message queue when employee data changes, providing an ideal point from which you can co-ordinate with other applications and business processes.

Initially Exolvo Integration Services (EIS) will cover:

- Adding an employee
- Updating an employee
- Deleting an employee

EIS is built on top of Sql Server Service Broker and Microsoft Message Queue (MSMQ) which provide proven reliable and flexible messaging facilities. The messages themselves are compliant with the HR-Xml 3.0 specification which ensures that system integrators have an open, well-defined and documented schema to work with. Further information on HR-Xml is available at <http://www.hr-xml.org>
